EXPERIENCE

Software Dev Engineer II **Promoted 2024 · Exceeds High Bar**

May 2022 – Present

Amazon Ads · Amazon Publisher Services

Austin, TX

Current scope (2025–2026, ad-serving / programmatic team)

- Owned end-to-end delivery of a programmatic deal-management product — wrote the majority of the deal-negotiation API and authored the API template that became the team's reference standard for future implementations.
- Stabilized publisher-planning oncall by designing OpenSearch sharding logic and a cluster-sizing model derived from planning-data characteristics — eliminated throttling caused by memory pressure.
- Designed and implemented bid-stream package-scaling end-to-end (UI · API · data orchestration); design doc benchmarked 5 architectural approaches on performance and latency before selecting the optimal.
- Diagnosed a cross-system regression where an internal revenue metric exceeded 100% — root-caused via catalog-deployment knowledge and provided architectural guidance for EU market expansion.
- Completed JDK 17 migration for the team's data-lake ETL service; built control-plane widgets and segments allow-list capability.
- Mentoring junior engineers on data pipelines and product operations; raising the team's code-quality bar through design-doc reviews.

Earlier scope (2022–2024, publisher reporting)

- Reduced infrastructure vulnerabilities from 200+ exposed instances to 1–2 at any time by adopting auto-patching and migrating Airflow stack from ECS to MWAA with tuned cluster configuration.
- Cut hourly Glue / Step-Functions / Lambda job runtime from over 60 minutes to under 15 minutes for advertiser-group ingestion — replacing the legacy EMR + Airflow approach.
- Delivered a unified deal-management feature in 4 weeks end-to-end (UI · portal reporting · sync Lambda) under aggressive timeline.
- Migrated programmatic-guaranteed creative-preview from Java to TypeScript, building API clients across 3 partner systems and a new async-loading React component.
- Architected AWS Lake Formation-based catalog unification (data lake + clean rooms) to optimize query performance and migrate bid-stream publishers off legacy storage.
- Recognition-pipeline fix secured \$500K incremental spend commitment from two top-10 beauty advertisers (sales-team-led).
- Authored 3 Operational Readiness Reviews; subject-matter expert on data pipelines and AWS CDK.

Tech: AWS (CDK, MWAA, EMR Serverless, Glue, Step Functions, Lambda, DynamoDB, Redshift, OpenSearch, Lake Formation), Java, Python, Scala, TypeScript, RxJS, Ruby on Rails, HAML, React.

Software Dev Engineer I

Sept 2021 – May 2022

Amazon B2B Payments · Flawless Invoice

Seattle, WA

- Built and operated invoice-validation services that gate enterprise outbound invoices in Amazon B2B Payments.
- Ramped on AWS CDK and LPT pipelines for Java Lambda services from zero prior exposure; closed Operational-Excellence backlog spanning AWS services new to the team.

Tech: AWS CDK, Java, Lambda, LPT pipelines.

SELECTED PROJECTS

Agent-to-Agent Deal Negotiation — Hackathon Winner	Internal · [Year]
Prototype demonstrating autonomous agent-to-agent negotiation for programmatic ad deals. Built supporting Model Context Protocol (MCP) integrations to broker capabilities between agents.	
Live-Event Ad Server — In Progress	Side · 2026
Ad server tailored for live-event traffic profiles. Event-driven architecture and micro-batch processing tuned for spike-load scenarios where conventional ad servers degrade.	
Outbreaks — Interactive D3 visualization	2021
Comparative dashboard for COVID-19 alongside historical outbreaks. Built with D3.js. → vivekvyellanti.github.io/outbreaks	

EDUCATION

MBA, Professional Format · Westcliff University	In Progress · Irvine, CA
MS, Data Science · University of Alabama at Birmingham	Jun 2021 · GPA 4.00 / 4.00
BTech, Computer Science Engineering · Vellore Institute of Technology	2015 – 2019 · GPA 7.71 / 10

SKILLS

Cloud / AWS	CDK, MWAA, EMR / EMR Serverless, Glue, Step Functions, Lambda, DynamoDB, Redshift, OpenSearch, Lake Formation, S3, VPC, federated API gateway
Languages	Java, Python, Scala, TypeScript, RxJS, Ruby, HAML
Frameworks	React, Ruby on Rails
Practices	Event-driven architectures, micro-batch ETL, distributed systems, ORRs, design reviews, oncall ops, mentorship
